

Developing a Document Management System (DMS) using Joget

Joget is a powerful low-code/no-code platform that enables rapid application development. When building a Document Management System (DMS), Joget significantly reduces the development time thanks to its visual builders, plugin extensibility, and easy integration with databases and external systems.

A DMS built on Joget can be quickly customized to meet business needs without writing extensive code. This makes it suitable for businesses looking to digitize document workflows efficiently and cost-effectively.

Key Features of Joget for DMS

1. Form Builder: Drag-and-drop form elements to design upload and metadata forms.
2. Process Builder: Create custom document approval workflows with ease.
3. User Management: Integrate with LDAP/AD or define custom roles and permissions.
4. File Storage: Store files securely in Joget or integrate with external storage systems.
5. Version Control: Maintain document versions and track changes automatically.
6. Access Control: Define who can upload, view, or edit documents.
7. Notifications: Email and in-app notifications for workflow events.
8. Audit Trail: Track user actions and document changes for compliance.

Benefits and Summary

Joget simplifies the development of a Document Management System through its intuitive interface and reusable components. It eliminates the complexity of traditional development and enables both developers and non-developers to collaborate on solutions.

Key Benefits:

- Faster Development Time
- Lower Cost of Implementation
- Easy Maintenance and Upgrades
- Customizable Workflows and Forms
- Seamless Integration with Other Systems

Joget is a reliable choice for building a DMS that is scalable, secure, and tailored to business needs.
